

# The ShorTeX package

Trevor Campbell, Jonathan Huggins, and Jeff Negrea

Updated April 11, 2023

## Abstract

The purpose of the ShorTeX (meta)package is to make the process of typesetting typical mathematical documents in L<sup>A</sup>T<sub>E</sub>X more efficient, and the resulting code easier to read. It achieves this by (1) providing an extensive, internally consistent, and easy to learn set of macro shorthands, (2) incorporating a set of packages that are dedicated to reducing manual coding effort, and (3) incorporating a collection of very common / standard boilerplate packages.

## 1 Usage and package options

Include ShorTeX by adding `\usepackage{shortex}` to the preamble of your document. ShorTeX will include and configure many common packages for you (e.g., `graphicx`, `subcaption`, `hyperref`, `algorithm`, `algpseudocode`, `amsmath`, among others), so you do not need to explicitly include and set these up yourself. If you are writing a document that must use a specific style file (e.g., for a conference or journal) that itself includes some of these packages, we recommend editing those style files to remove the package imports.

The ShorTeX package has a few options:

**manualnumbering** Do not include `autonum.sty`. This disables automatic equation numbering.

**blackhypersetup** Switch hyperlinks, citations, references, etc. to be typeset in black font. The default is dark blue.

**You must compile your document 4 times when using ShorTeX** to ensure that equation numbers and references update properly.

## 2 Packages included in ShorTeX

### 2.1 Internal packages

The following packages provide features that are used internally in ShorTeX for macro definitions etc.

**xifthen, xstring, xspace, xargs** asdf

### 2.2 Typical packages

We include a set of typical packages to avoid the problem of having to remember precisely what order to import each one, which options, compatibility, etc

It is worth noting that we did not include a standard bibliography package in ShorTeX (e.g., `natbib.sty`). This is because...

**mathrsfs,dsfont,amsmath,amssymb,amsthm,bm,bbm,amsfonts,mathtools,thmtools**  
asdf

**hyperref** asdf

**color** asdf

**algorithm, algpseudocode** asdf

**graphicx** asdf

## 2.3 Improvement packages

**cleveref** Typically to use a reference in L<sup>A</sup>T<sub>E</sub>X, you have to write the name of the type of reference yourself. For example, if you want to reference a figure, you would have to write something like:

In Figure `\ref{fig:first}`, you can see...

Or for multiple figures, you might use:

Figures `\ref{fig:first}`, `\ref{fig:second}`,  
and `\ref{fig:third}` show that...

The **cleveref** package simplifies this process significantly. Use the `\cref` command to automatically typeset the names of the objects you're referencing (including properly handling multiple references). The above two examples become

In `\cref{fig:first}`, you can see...

and

`\cref{fig:first,fig:second,fig:third}` show that...

This works for many different reference types (Figure, Algorithm, Equation, Table, etc), and can be extended if needed. See the **cleveref** documentation at <https://ctan.org/pkg/cleveref?lang=en> and the homepage at <https://www.dr-qubit.org/cleveref.html> for more information.

**autonum** Typically when you typeset equations, you have to choose between `$...$`, `$$...$$`, `\begin{align}...\end{align}`, `\begin{aligned}...\end{aligned}`, `\begin{equation}...\end{equation}`, not to mention starred versions of those environments and `\nonumber`/`\notag` commands, depending on whether/where you want equation numbers, display or in-text math, etc. This leads to verbose, inconsistent code.

The **autonum** package automatically decides which equations to provide numbers based on *which equations you reference*. So when using ShorTeX, you only need two commands for math mode: single dollar signs `$...$` for inline math, and `align` environments (redefined in ShorTeX to be `\[...\]`) for display math.<sup>1</sup>

For example, if you create the following display math,

---

<sup>1</sup>Note that there are minor differences between how `align` and `equation` display equations. But after 10+ years of using L<sup>A</sup>T<sub>E</sub>X, I have not ever encountered a case where it mattered much. That being said, ShorTeX does not *disable* any functionality, so you can use the usual environments anywhere you feel it is necessary.

```
\[
  a+b = c \label{eq:the_equation}
\]
```

then if you use the command `\cref{eq:the_equation}` somewhere in the document, that equation will automatically be assigned a number. If not, it won't get a number. See the `autonum` package documentation <https://ctan.org/pkg/autonum?lang=en> for more information.

`nicefrac` asdf

`crossreftools` asdf

`multirow` asdf

`wrapfig` asdf

`caption,subcaption` asdf

`microtype` asdf

`booktabs` asdf

`import,subfiles` asdf

`url` asdf

## 3 Shorthands for existing commands

### 3.1 Commenting

ShorTeX defines two types of comments that can be used (*remarks* and *problems*), and provides an inline and margin style for each.

| Comment Type   | Syntax                                     |
|----------------|--|
| remark         | <code>\RMK{Example remark}</code>          |
| margin remark  | <code>\mRMK{Example margin remark}</code>  |
| problem        | <code>\PRB{Example problem}</code>         |
| margin problem | <code>\mPRB{Example margin problem}</code> |

Here is an example of how these look in a typical paragraph:

Lorem ipsum dolor sit amet (!) Here is an inline remark, consectetur adipiscing elit, sed do eiusmod tempor incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation (!! ) Here is an inline problem ullamco laboris nisi ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit in (1) voluptate velit esse cillum dolore eu fugiat nulla pariatur. Excepteur sint occaecat ((2)) cupidatat non proident, sunt...

(1) Here is a margin remark  
((2)) Here is a margin problem

## 3.2 Environments

L<sup>A</sup>T<sub>E</sub>X documents often includes a lot of verbose code related to creating environments (`\begin{blah}...\end{blah}`). ShorTeX provides a set of shortened macros for common environments. Note that all theorem-like environments (theorem, lemma, proposition, etc.) are numbered by default; unnumbered versions can be obtained by appending a `u`. For example, `\bthmu...\ethmu` creates an unnumbered theorem environment, while `\blemu...\elemu` creates an unnumbered lemma environment.

| Environment   | Syntax   |
|---|--|
| abstract  | <code>\babs...\eabs</code>                           |
| itemize   | <code>\bitems...\eitems</code>                       |
| enumerate   | <code>\benum...\eenum</code>                         |
| description   | <code>\bdesc...\edesc</code>                         |
| algorithm   | <code>\balg...\ealg</code>                           |
| algorithmic   | <code>\balgc...\ealgc</code>                         |
| table   | <code>\btabs...\etabs</code>                         |
| subtable  | <code>\bsubtab...\esubtab</code>                     |
| tabular   | <code>\btabr...\etabr</code>                         |
| figure  | <code>\bfig...\efig</code>                           |
| figure*   | <code>\bfigs...\efigs</code>                         |
| subfigure   | <code>\bsubfig...\esubfig</code>                     |
| center  | <code>\bcent...\ecent</code>                         |
| align   | <code>\[...\]</code>                                 |
| inline math   | <code>\$_\$_</code>                                  |
| <i>Note: These are numbered theorem-like environments.<br/> For unnumbered, append a u: e.g., <code>bthmu...ethmu</code>.</i> |  |
| theorem   | <code>\bthm...\ethm</code>                           |
| lemma   | <code>\blem...\elem</code>                           |
| proposition   | <code>\bprop...\eprop</code>                         |
| corollary   | <code>\bcor...\ecor</code>                           |
| conjecture  | <code>\bconj...\econj</code>                         |
| definition  | <code>\bdef...\edef</code>                           |
| assumption  | <code>\bassump...\eassump</code>                     |
| example   | <code>\bexa...\eexa</code>                           |
| remark  | <code>\brmk...\ermk</code>                           |
| fact  | <code>\bfact...\efact</code>                         |
| exercise  | <code>\bexer...\eexer</code>                         |
| proof   | <code>\bprf...\eprf</code>                           |
| proofof   | <code>\bprfof{\cref{theorem_label}}...\eprfof</code> |
| matrix  | <code>\bmat...\emat</code>                           |
| bmatrix   | <code>\bbmat...\ebmat</code>                         |
| pmatrix   | <code>\pmat...\epmat</code>                          |

### 3.3 Delimiters

Mathematics in L<sup>A</sup>T<sub>E</sub>X often includes quite a few delimiters (parentheses, brackets, curly brackets, etc.). A very common usage of these involves the `\left...\right` commands for automatic sizing. One can also use `\bigl...\bigr`, `\Bigl...\Bigr`, `\biggl...\biggr`, `\Biggl...\Biggr` to control sizing manually. ShorTeX creates shorthands for these.

| Description | Syntax                   |
|-------------|--------------------------|
| automatic   | <code>\lt...\rt</code>   |
| big         | <code>\lb...\rb</code>   |
| Big         | <code>\lB...\rB</code>   |
| bigg        | <code>\lbg...\rbg</code> |
| Bigg        | <code>\lBg...\rBg</code> |

These can be applied to all the usual delimiter characters. The following tables demonstrate usage for automatically sized delimiters.

| Description     | Example                                | Text style                             | Display style                          |
|-----------------|--|--|--|
| parentheses     | <code>\lt(\frac{x}{y}\rt)</code>       | $\left(\frac{x}{y}\right)$             | $\left(\frac{x}{y}\right)$             |
| curly brackets  | <code>\lt\{\frac{x}{y}\rt\}</code>     | $\left\{\frac{x}{y}\right\}$           | $\left\{\frac{x}{y}\right\}$           |
| square brackets | <code>\lt[\frac{x}{y}\rt]</code>       | $\left[\frac{x}{y}\right]$             | $\left[\frac{x}{y}\right]$             |
| pipes           | <code>\lt \frac{x}{y}\rt </code>       | $\left \frac{x}{y}\right $             | $\left \frac{x}{y}\right $             |
| double pipes    | <code>\lt\ \frac{x}{y}\rt\ </code>     | $\left\ \frac{x}{y}\right\ $           | $\left\ \frac{x}{y}\right\ $           |
| angle brackets  | <code>\lt&lt;\frac{x}{y}\rt&gt;</code> | $\left\langle\frac{x}{y}\right\rangle$ | $\left\langle\frac{x}{y}\right\rangle$ |

### 3.4 Font styles and accents

Out of the box we can get all sorts of cool fonts in math mode using `\f[<fontcodestring>]A`. For the time being I only implemented 2 fonts and 1 accent. These can be expanded once everything else is set. We see the effect of single font codes:

`\f[b]A`   **A**  
`\f[k]A`    $\mathbb{A}$   
`\f[h]A`    $\hat{A}$

And multiple font codes:

`\f[bh]A`    $\hat{\mathbf{A}}$   
`\f[hb]A`    $\hat{\mathbb{A}}$   
`\f[hk]A`    $\hat{\mathbb{A}}$   
`\f[kh]A`    $\mathbb{\hat{A}}$

Note that these are expanded in the reverse of the order they appear: the font code furthest to the right is applied first. This matches the order that the corresponding commands would appear in TeX code.

We can also avoid typing `[]` for some combinations of font codes we sue frequently. To do this, use `\parsefontstylesstrings{\{<fcstr1>\},\{<fcstr2>\},...\}\{<alphabet>\}`

as demonstrated below. For “ease of use” we have implemented `\upperCaseRomanLetters` and `\lowerCaseRomanLetters`

|  |                        |
|--|------------------------|
| <code>\parsefontstylesstrings{\hb},{hk}\{ABCDEFG\}</code>                | ...                    |
| <code>\parsefontstylesstrings{\hb},{hk}\{\lowerCaseRomanLetters\}</code> | ...                    |
| <code>\fhbA</code>   | $\widehat{\mathbb{A}}$ |
| <code>\fhkB</code>   | $\widehat{\mathbb{B}}$ |
| <code>\fhbX</code>   | $\widehat{\mathbf{x}}$ |
| <code>\fhbY</code>   | $\widehat{\mathbf{y}}$ |
| <code>\fhkZ</code>   | $\widehat{f}$          |

Since `\mathbb{<lowercaseletter>}` is defined to give weird characters, our macros do the same.

## 4 Custom mathematics macros

### 4.1 Sets and set operations

$\mathbb{R}\overline{\mathbb{R}}\mathbb{R}_+\overline{\mathbb{R}}_+\mathbb{R}_{++}\overline{\mathbb{R}}_{++}\mathbb{Z}\mathbb{Z}_+\mathbb{Q}\mathbb{Q}_+\mathbb{N}\mathbb{N}_0\mathcal{C}\mathcal{M}\mathcal{M}_1\mathcal{P}\cup\cup\sqcup\cap\bigcap$  vol diam cl span  $\partial$  cone conv

### 4.2 Linear algebra

$$\mathrm{tr} \otimes A^\dagger \sigma \mathrm{diag} \mathrm{rank} \, A^\top A^{-\top}$$

### 4.3 Calculus

$$\mathrm{d}\nabla \frac{\mathrm{d} x}{\mathrm{d} y} \frac{\mathrm{d}^2 x}{\mathrm{d} y^2} \frac{\mathrm{d}}{\mathrm{d} y} \frac{\partial x}{\partial y} \frac{\partial^2 x}{\partial y^2} \frac{\partial^i x}{\partial y^i} \frac{\partial}{\partial y} \frac{\partial^2 a}{\partial x \partial y} \frac{\partial^2}{\partial x \partial y}$$

### 4.4 General mathematics

$$\mathbb{1} \operatorname{sgn} 3 \times 10^5 \mathrel{:} |$$

improved square root  
text in math?

$$:= =: {}^{1/2} / {}^{1/3} / {}^{1/4} \arg \max \operatorname{ess} \sup \arg \min \operatorname{ess} \inf$$

## 4.10 new approach to annotation commands

## 5 Example Document

TODO: a full example in basic latex versus shortex

## 5.1 Paired Delimiters

You can specify a bracket size using `*` for `\left` and `\right` or one of the standard size choices (`\big`, `\Big`, `\bigg`, `\Bigg`).

| Description     | Example                                | Text style        | Display style     |
|-----------------|--|-------------------|-------------------|
| Round brackets  | <code>\rbra{\frac{x}{y}}</code>        | $(\frac{x}{y})$   | $(\frac{x}{y})$   |
| Curly brackets  | <code>\cbra*{\frac{x}{y}}</code>       | $\{\frac{x}{y}\}$ | $\{\frac{x}{y}\}$ |
| Square brackets | <code>\sbra[\bigg]{\frac{x}{y}}</code> | $[\frac{x}{y}]$   | $[\frac{x}{y}]$   |

Many other bracket-like, semantic commands are also available:

| Description    | Example                                       | Text style                               | Display style                            |
|----------------|---|--|--|
| Absolute value | <code>\abs{\frac{x}{y}}</code>                | $ \frac{x}{y} $                          | $ \frac{x}{y} $                          |
| Set            | <code>\set{\frac{x}{y}, \frac{y}{z}}</code>   | $\{\frac{x}{y}, \frac{y}{z}\}$           | $\{\frac{x}{y}, \frac{y}{z}\}$           |
| Floor          | <code>\floor{\frac{x}{y}}</code>              | $\lfloor\frac{x}{y}\rfloor$              | $\lfloor\frac{x}{y}\rfloor$              |
| Ceiling        | <code>\ceil{\frac{x}{y}}</code>               | $\lceil\frac{x}{y}\rceil$                | $\lceil\frac{x}{y}\rceil$                |
| Norm           | <code>\norm{\frac{x}{y}}</code>               | $\ \frac{x}{y}\ $                        | $\ \frac{x}{y}\ $                        |
| Inner product  | <code>\inner{\frac{x}{y}}{\frac{y}{z}}</code> | $\langle\frac{x}{y}, \frac{y}{z}\rangle$ | $\langle\frac{x}{y}, \frac{y}{z}\rangle$ |
| Cardinality    | <code>\card{\wh A}</code>                     | $ \hat{A} $                              | $ \hat{A} $                              |

The norm and inner product commands also have versions with a subscript argument:

| Description                  | Example  | Text style                                 | Display style                              |
|------------------------------|--|--|--|
| Norm with subscript          | <code>\normsub*{\frac{x}{y}}{2}</code>               | $\ \frac{x}{y}\ _2$                        | $\ \frac{x}{y}\ _2$                        |
| Inner product with subscript | <code>\innersub*{\frac{x}{y}}{\frac{y}{z}}{2}</code> | $\langle\frac{x}{y}, \frac{y}{z}\rangle_2$ | $\langle\frac{x}{y}, \frac{y}{z}\rangle_2$ |
